

The days of failing to get sufficient signal to watch our favourite Netflix shows on the go are certainly a thing of the past, as the introduction of 5G data has meant that signal can now be found everywhere.

That has a huge impact on daily life for many, as they can watch their favourite shows during daily commutes and also take advantage of free spin [offers](#) at PlayOrBet to play some of the leading casino games when stopping for lunch. However, what other impacts can we expect from the development of 5G over the coming years?

Wireless Wi-Fi

One of the most exciting developments that will be made following the 5G developments isn't one that many would have expecting. The advancements in technology mean that wireless home broadband will be a thing of the past, as homeowners will soon be able to get wireless networks hubs.

At present, wires are needed to connect to Wi-Fi in homes around the world, with some unlucky enough not to have the quickest Wi-Fi speeds due to the area that they live in. However, that will soon change, as Wi-Fi routers will become wire-free, which means everyone will be able to get super-fast network speeds regardless of where they live.

Self-Driving Cars

One of the most exciting advancements that will be made thanks to the developments made in 5G will be the introduction of self-driving cars. Of course, this is still a concept that will scare many, as it will require putting all trust in technology to avoid crashes. However, the speeds of 5G means that self-driving cars will be safe around the biggest cities in the world, as they will be able to connect to real-time maps to avoid the cars on the road, and also take the fastest routes possible.

It is likely to become more prominent in the biggest cities first, as the coverage available will be much bigger. However, there are hopes in the future that self-driving cars could become the norm around the world.

Cloud Gaming

Gaming companies and developers are always looking for fresh ways to stand out from the

crowd, and with 5G, they have one of the most exciting developments in years. At the moment, players will need to be at home with their consoles to play their favourite titles. However, it is expected that in the future, gamers will be able to connect to the cloud and play some of their favourite titles on smartphones.

It could be one of the most exciting advancements made in the industry for many years, as players will no longer need to have a handheld device to play huge titles, as they will simply just need the required pieces of equipment and their handheld device. However, further developments are likely to be made to ensure that mobile gamers have the required battery life that they need to make sure that their mobile's battery isn't drained.
